

# 1. Jupyter Notebook

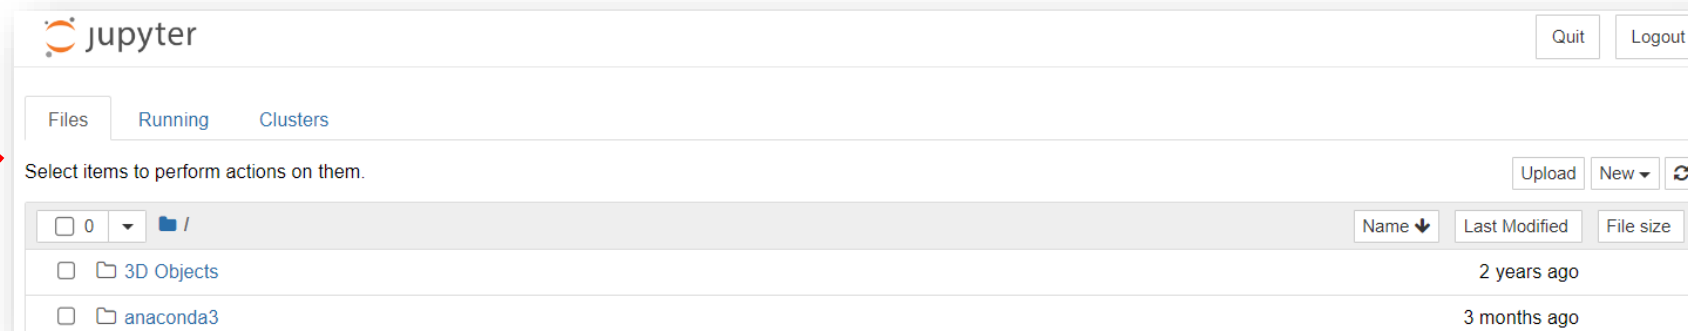

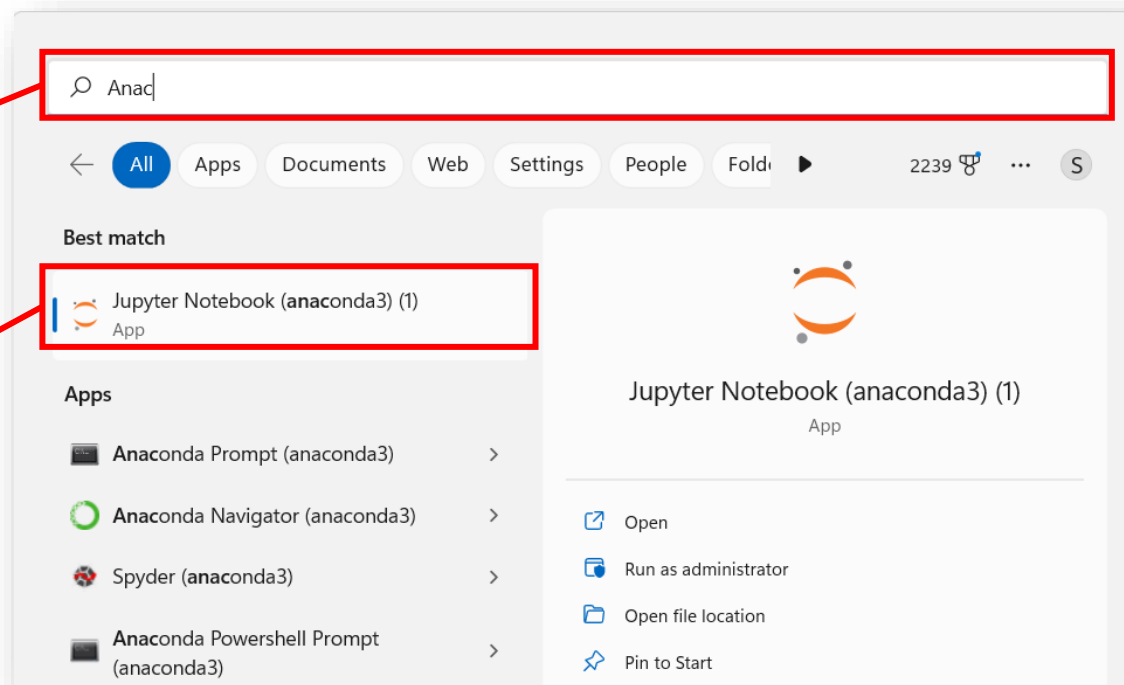

# Jupyter Notebook – Launch (Method 1)

**Step 1** - Type *Anaconda* in search bar

**Step 2** – Click 'Jupyter Notebook' to launch it

**Step 3** – Jupyter Notebook opens in your default Browser (preferably chrome)

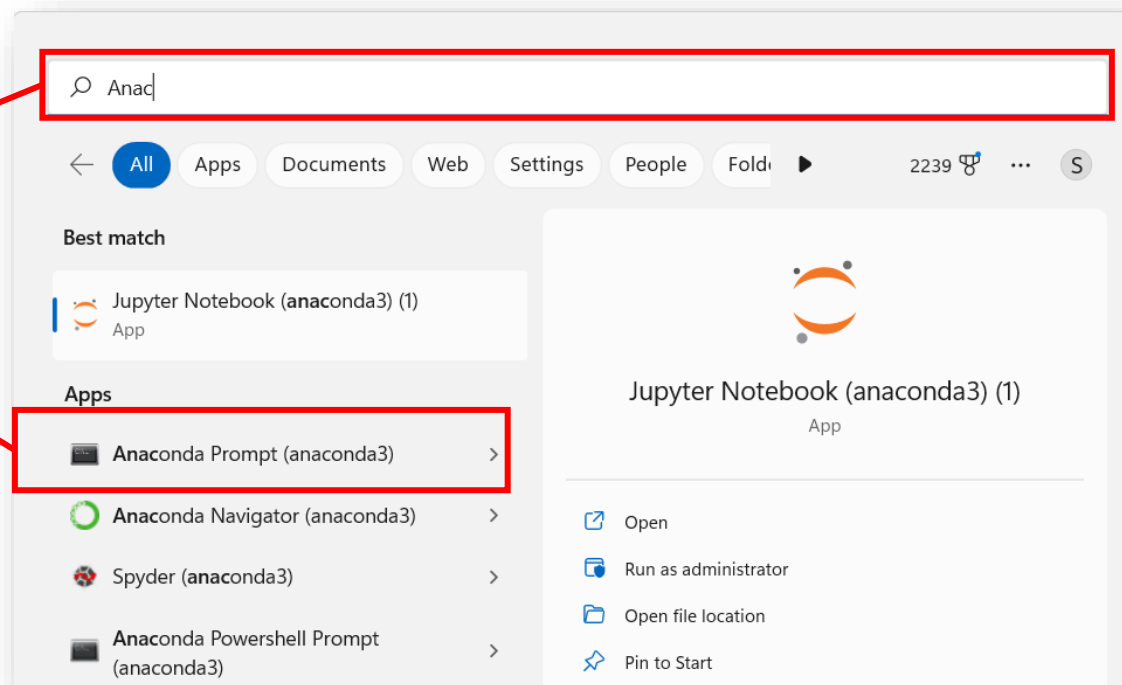

# Jupyter Notebook – Launch (Method 2)

**Step 1 - Type**  
*Anaconda* in search bar

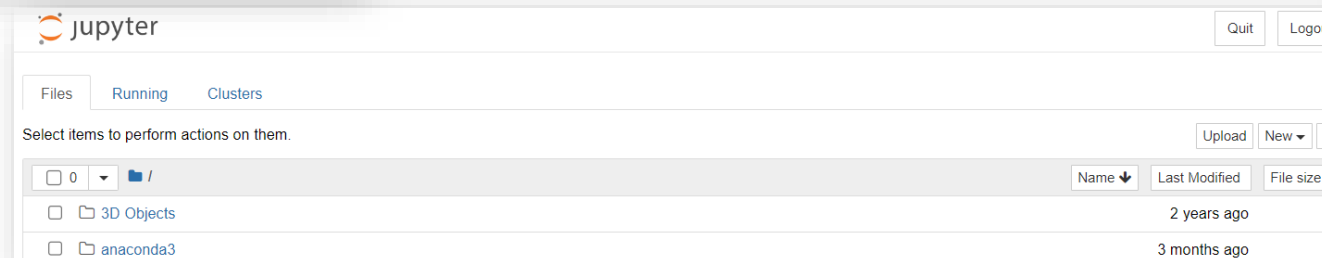

**Step 2 – Click**  
'Anaconda Prompt' to  
launch anaconda prompt

**Step 3 – Type 'Jupyter  
notebook' in anaconda  
prompt and press ENTER**

```
Anaconda Prompt (anaconda3)
(base) C:\Users\satya>jupyter notebook
```

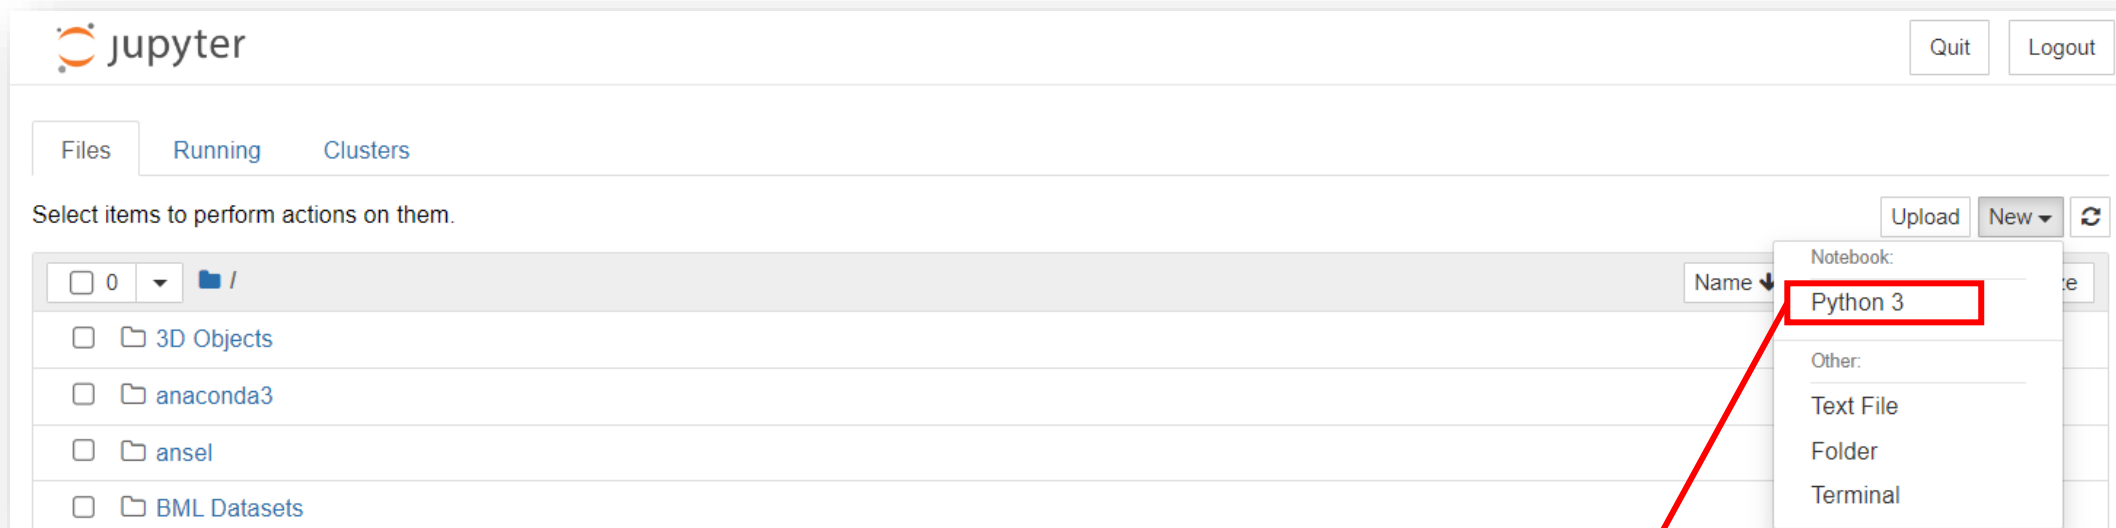

**Step 4 – Jupyter  
Notebook opens in your  
default Browser  
(preferably chrome)**

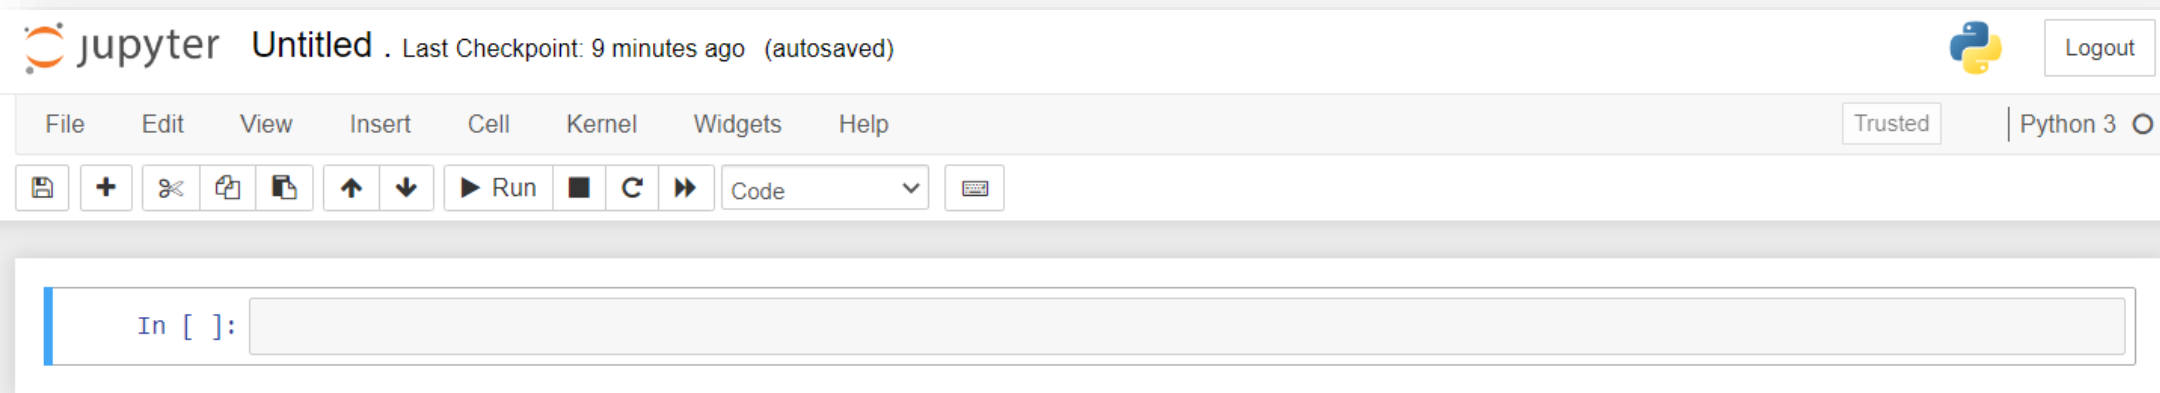

# Launching Python

This is how the interface looks like. This is where all the magic happens !!

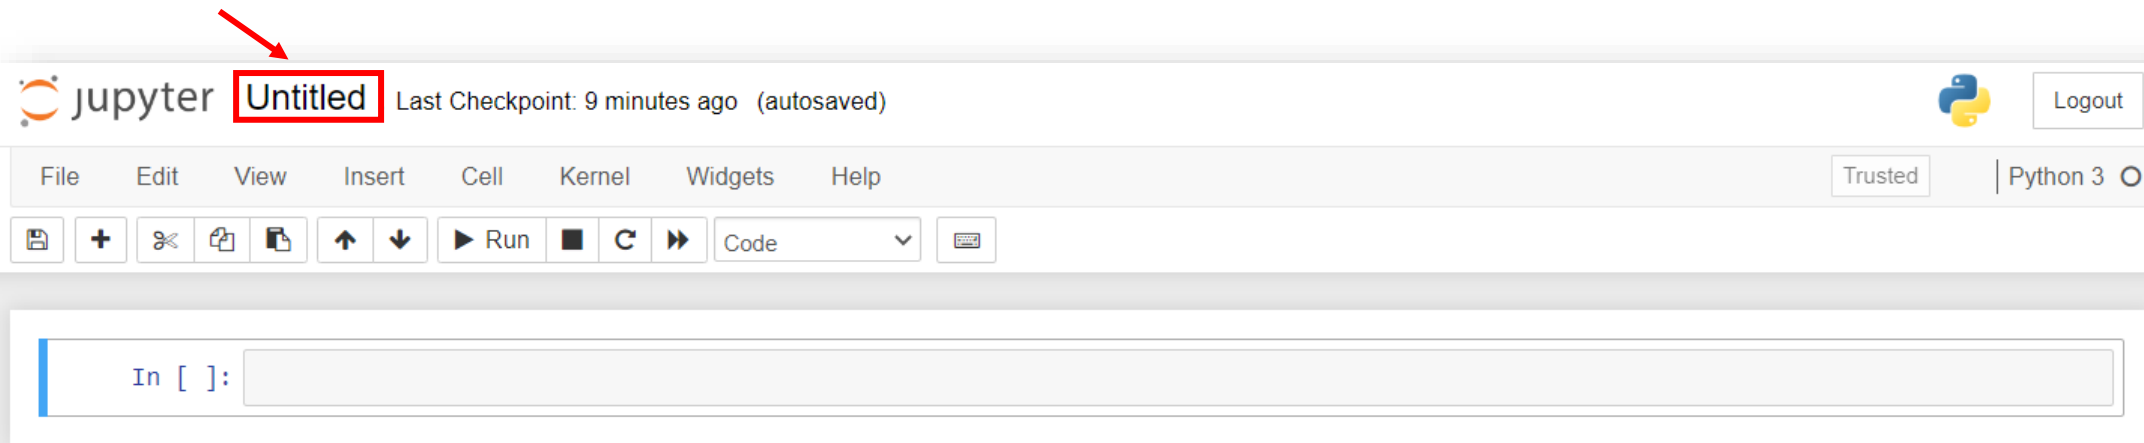

With Jupyter Notebook open, click on 'New' -- > Python 3 to launch a Python Notebook in a new tab

# Getting started with a new Python Notebook !

The default name would be 'Untitled'.

If you go back to the tab with your dashboard view, you should be able to see a new entry **Untitled.ipynb**

|                          |                             |                               |              |
|--------------------------|-----------------------------|-------------------------------|--------------|
| <input type="checkbox"/> | Trees - Pruning.ipynb       | 3 months ago                  | 644 kB       |
| <input type="checkbox"/> | Trinomial random Walk.ipynb | 5 months ago                  | 15.1 kB      |
| <input type="checkbox"/> | <b>Untitled.ipynb</b>       | <b>Running</b> 11 minutes ago | <b>576 B</b> |
| <input type="checkbox"/> | Untitled1.ipynb             | 4 months ago                  | 1.47 kB      |
| <input type="checkbox"/> | Untitled2.ipynb             | 3 months ago                  | 936 B        |

The file gets created in `C:\Users\{Your username}` folder. You can copy that file and save it in another location if you want. For each such Notebook you create, it will create a .ipynb file.

# The Notebook Interface

Select a cell and hit 'Run' to execute the code ( shortcut **CTRL + ENTER** )

**Kernel** – It's the computational engine that runs your code

**Command Palette** – contains keyboard shortcuts for handling the Notebook in command mode'

Rank order of execution of the cell  
\* indicates, the cell is being processed

Blue Line – Command Mode  
Green Line – Edit Mode

It's the **Cell** Input. Write code here.

It's the **Cell** Output.

**Kernel** – It's the engine that runs your code and give outputs.

**Cell** – It's the container of text, code Input and code output.

**Mode** – In the Notebook, there is always one Active cell. The cell can be in Command mode (Blue Line) when clicked outside of the Input box or Edit Mode (Green Line) when clicked inside the Input box.

# Keyboard shortcuts when cell is in command mode

---

| Keyboard Shortcuts in Command Mode | Purpose                                        |
|------------------------------------|------------------------------------------------|
| Esc or Enter                       | Toggle between the modes                       |
| Up or Down                         | To jump from cell to cell                      |
| A or B                             | To insert a cell above or below an active cell |
| Y or M                             | To switch between Code Cell and Markdown Cell  |
| Double tap 'D'                     | Delete a cell                                  |
| Z                                  | Undo deletion                                  |
| Shift + Up or Down                 | To select more than one cells                  |
| Shift + M                          | Merge more cells to one                        |

# Your First Code

---

Click on the Input box (Notice the color turning green). Enter the following piece of code and hit Run or press **CTRL + ENTER** on keyboard. You will see the output.

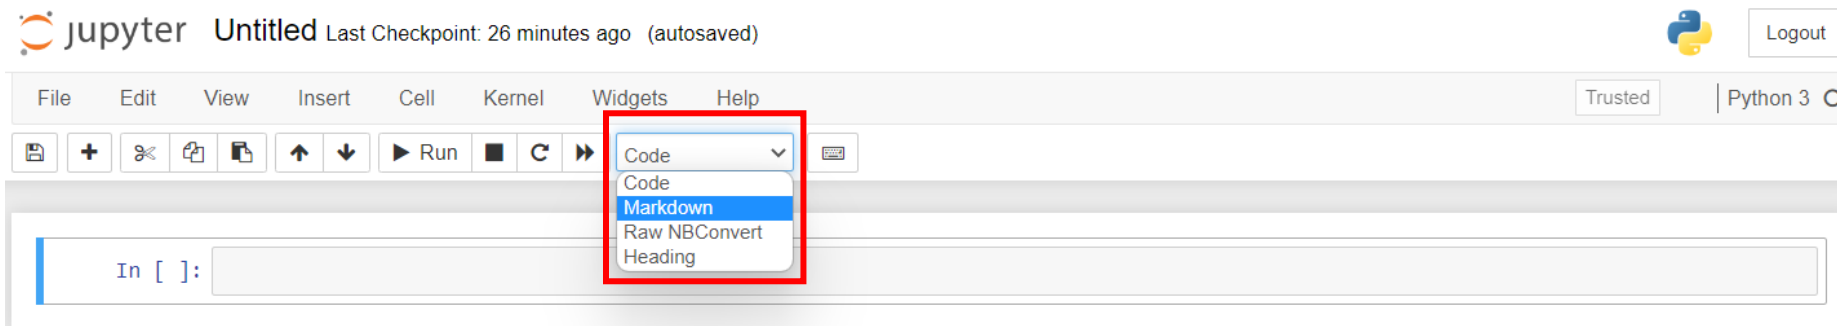

```
In [9]: print("Hello World!")
```

```
Hello World!
```

# Markdown

Use [Markdown](#) option for text styling (Heading, Sub-heading, Bold etc...). It's recommended to use [Markdown](#) and put section headings to make the document more presentable. Choose 'Markdown' instead of code in the dropdown as below and enter the following code and run. The output is self-explanatory.

## Input

```
# First Heading
## Sub-Heading
**Bold** *Italic*
1. List Item 1
2. List Item 2

[Click here to visit website](https://peaks2tails.com/default)
```

## Output

**First Heading**

**Sub-Heading**

**Bold *Italic***

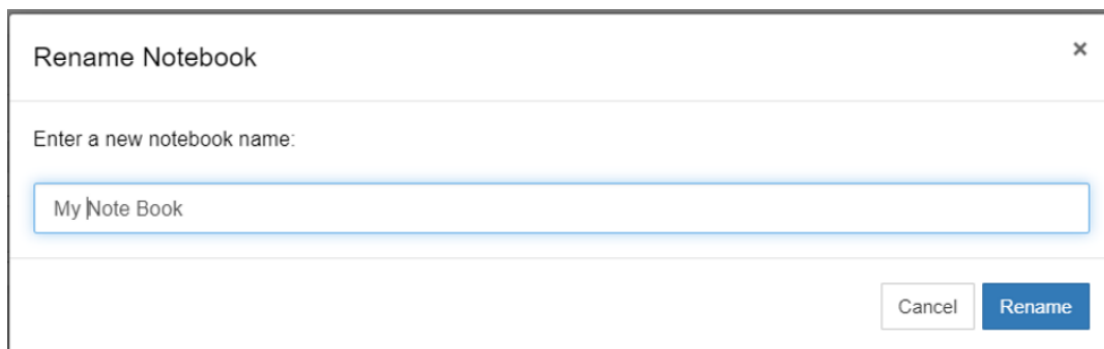

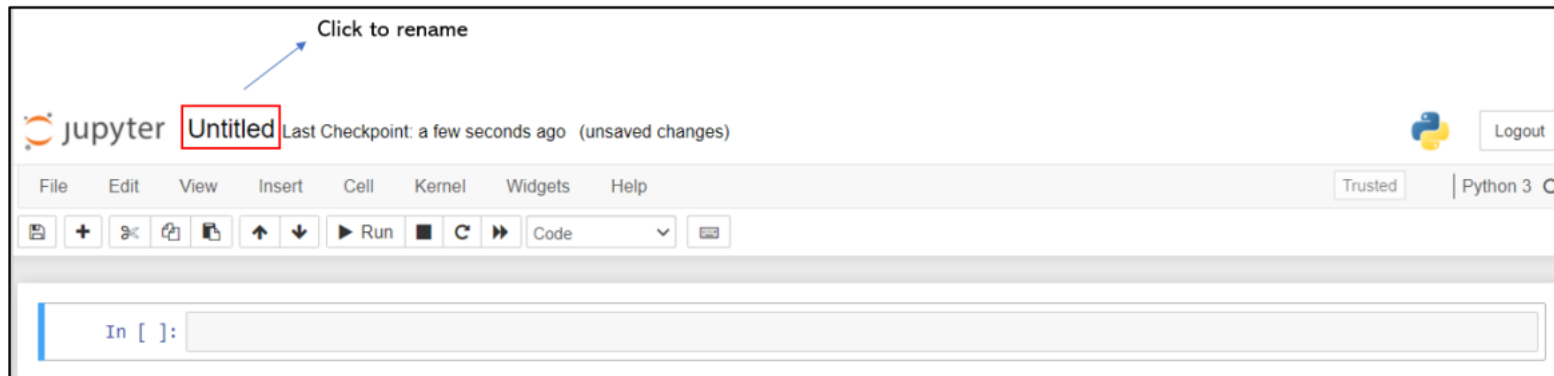

1. List Item 1
2. List Item 2

[Click here to visit website](https://peaks2tails.com/default)

# Rename and Save

By default, the name of your Notebook will be [Untitled](#). To give it a different name, click on the name, type in a new name and hit Save (the floppy icon or CTRL + S). A good habit is to press CTRL + S time to time to avoid unexpected disasters.

That should be enough on Jupyter Notebook to get you started. Have fun !
